 AB- <PN> WO 200275500 A2|
 AB- <NV> NOVELTY - The medium includes computer-executable instructions for
 performing the steps of: identifying a time window in which a delivery
 may be made to a customer, determining a cost of delivery and comparing
 the cost of delivery with a threshold cost. (The cost of delivery
 comprises a cost of making the delivery to the customer within the time
 window.) Responsive to the cost of delivery being less than the
 threshold cost, it is indicated that the time window is available for
 the delivery.|
 AB- <BASIC> DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for
 (1) a method of displaying delivery time windows
 (2) a method of determining whether to offer to make a requested
 delivery within a particular delivery time window
 (3) a system for generating a concrete mix design.
 USE - For delivery **scheduling system** over a network.
 ADVANTAGE - Only **schedules deliveries** in particular time window
 if it is possible to make all scheduled **deliveries** within time window
 and if it makes business sense to make each delivery within same time
 window.
 DESCRIPTION OF DRAWING(S) - The figure shows the system.

 AB- <NV> NOVELTY - The vehicle **schedule** stored in memory identifies
 packages to be delivered by vehicle during a period and indicates order
 packages. A communications device (61) e.g. telephone, pager etc is
 configured to establish communication via network (63) with remote
 communications devices (18).|
 AB- <BASIC> DETAILED DESCRIPTION - A **system** manager is configured to
 analyze vehicle **schedule** and to determine, based on order expected
 deliver time. The system manager transmits a notification message
 (e-mail) via communications device (61) e.g. telephone, pager etc to
 recipient. An INDEPENDENT CLAIM is also included for a method of
 reporting impending vehicle **deliveries** .
 USE - For reporting impending vehicle **deliveries** via network.
 ADVANTAGE - It notifies recipients of the precise package delivery
 time.
 DESCRIPTION OF DRAWING(S) - The figure shows block diagram
 illustrating a package delivery notification system.

The phone has appropriate software so that the phone transmits its location on an ongoing basis when 999 is dialled. The same applies to any emergency call. When combined with a traffic monitoring system, the phone with GPS is able to warn drivers that their route is blocked, so permitting them to select another route. Journey **planning** may also be aided by use with a route **planning program** .

Companies may increase efficiency of operations such as delivery, by installing software permitting phones carried by their employees to respond to 'Where are you queries and using the data so obtained to plan **deliveries** . Similarly, lost or stolen mobile equipment could be traced by analysing the responses to interrogation by the network.

The system includes a number of microcomputers interconnected via a network such that a fully redundant capability is provided. Each of the work stations control text and/or graphics monitors. Information in the graphics monitors are based upon a digitised map base of the vehicle delivery areas, such that vehicle pick-up, **deliveries**, minimum path routes and vehicle delivery zones are displayed in an icon-based format.

The software selects suitable vehicles and calculates minimum travel time base upon a tree-node decision algorithm that matches street distances, and travel times to real traffic conditions. The software also includes a fully integrated third party billing and business operations accounting package that enables fully automated dispatch system operation.

ADVANTAGE - Optimises the utilisation of vehicles.

Dwg.1/6|

AB- <US> US 5122959 A

The system includes a plurality of microcomputers interconnected via a BIT-BUS network such that a fully redundant capability is provided. Each of the work stations control text and or graphics monitors. Information in the graphics monitors are based upon a digitised map base, such as the US Census Bureau GBF file or 'DIME File' of the vehicle delivery areas, such that vehicle pickup, **deliveries**, minimum path routes and vehicles delivery zones are displayed in an icon based format.

The software of the system calculates minimum travel time based upon a tree node decision algorithm that matches street distances, and travel times to real traffic conditions. Candidate vehicles for **pickups** and **deliveries** are selected upon a user defined set of factors that include time, speed, vehicle characteristics and distance factors. The software also includes a fully integrated third party billing and business operations accounting package that enables fully automated dispatch system operation.

USE - Vehicle dispatch system that performs the management, coordination and communication functions for dispatching vehicles|

 AB- <BASIC> WO 9606766 A

The system includes a system wide planner or order scheduler (200), a planner/dispatcher (204), a safety insurer (206) and a train controller (208). The system wide planner is responsible for overall system planning in allocating the resources to meet the orders in an **optimal** manner. The **planner** develops a coarse **schedule** and passes it to the planner/dispatcher.

The planner/dispatcher determines a detailed schedule to produce a movement plan. The movement plan is used by the dispatching portion to be transmitted to the train controller. The movement plan is checked by the safety insurer to verify that the movements will not result in trains being placed in unsafe situations.

ADVANTAGE - Optimally schedules multipath **deliveries** safely.

Dwg.3/111

AB- <US> US 5623413 A

A method of planning over a predetermined period of time the use of resources in a freight railway system to reduce the costs of the plan, comprising the steps of:

(a) developing strategic schedule constraints on train movement in a rule based inference engine based on user-defined freight railway operating rules and an **optimization** of proposed **schedules** under relaxed constraint conditions; and

(b) developing a detailed movement plan in a constraint based

inference engine based upon an optimization within a predetermined tolerance of the costs of the movement plan wherein the strategic schedule constraints developed by the rule based inference engine are provided as sequencing constraints to the constraint based inference engine for development of the movement plan.

Conventional address book functionality is provided and **enhanced** as follows: Integrated access to project **planning** software. When the project planner is accessed, a person's projects are displayed in a multimedia manner, e.g., an animated depiction of progress over time, current status, etc.

Deliverables can be accessed via hypermedia links. Multimedia annotation of status, schedules, and deliverables is allowed, together with direct mailing of comments to the owner. Multimedia based access and security is provided, e.g., using voice print, signature analysis, etc.

USE/ADVANTAGE - New functionality and flexibility, improved integration of applications, improved usability, reduced work steps, and reduced errors.

The transport vehicle guidance system uses a control processor (VLR), receiving information relating to the individual destinations, coupled to a **route** processor (TRR) which calculates the **optimal** vehicle **route**.

This is transported to a route planar (TR) for providing a full route itinerary for each vehicle. This itinerary provides the name, address and map coordinates of each customer and lists these in order for the successive **deliveries** with the route indicated by a succession of guidance vectors.

Pref. the information is transmitted to each vehicle via a radio transceiver supported by a mask at the depot. ADVANTAGE - Efficient delivery with min. wastage of time and fuel.

INTERNATIONAL PATENT CLASS: G06F-017/30

ABSTRACT EP 1160694 A2

An improved method and system for specifying physical locations when using applications run on navigation systems or other computer platforms that provide navigation- or map-related functions. When requesting a navigation- or map-related function from such an application, a user specifies a physical location using a keyword instead of specifying the physical location conventionally, such as by street address. A keyword database relates keywords to physical locations. The application uses the keyword database, or a copy thereof, to find data indicating the physical location associated with the keyword specified by the user. Preferably, physical locations are defined in the keyword database in terms of data in a corresponding geographic database. The application then performs the requested navigation- or map-related function using the data indicating the physical location associated with the keyword. The keyword database is built using input from users. An on-line system is provided that users can access to associate keywords with physical locations. A user accessing the on-line system is presented with a map from which a physical location can be selected. A keyword, which may be selected by the user, is associated with the selected physical location. The keyword is stored in the keyword database along with data indicating the associated physical location. Keywords can be related to each other in order to facilitate navigation applications that involve routing through multiple locations.

ABSTRACT EP 282359 A2

Apparatus for preparing a letter is provided, which includes printing
 STRUCTURE (200), stationery item supplying structure (160) and a computer
 (120). The computer (120) is constructed and arranged for receiving a
 signal representative of letter data corresponding to information having
 a format. The information includes a plurality of parts. The computer
 (120) includes structure for reformatting the letter data. The
 reformatted letter data includes a plurality of parts. Each of the
 information parts corresponds to a different one of the data parts. The
 computer (120) also includes structure for selecting at least one of the
 data parts, causing the supplying structure to supply the stationery item
 to the printing structure and causing the printing structure to print on
 the stationery item the information part corresponding to the selected
 data parts.

French Abstract

L'invention concerne un systeme, un procede et un article manufacture

destines a afficher des phases de fourniture de composants d'un systeme, en affichant d'abord une representation picturale d'un systeme existant comprenant plusieurs composants. Ensuite, une premiere serie de composants a fournir dans une premiere phase est presentee. Cette operation s'effectue par codage indiciel de la premiere serie de composants, de facon specifique. Par la suite, une deuxieme serie de composants a fournir dans une deuxieme phase est presentee. Cette operation s'effectue par codage indiciel de la deuxieme serie de composants, de facon unique par rapport au codage indiciel de la premiere serie de composants.

English Abstract

A hybrid telecommunication system includes a switched network which transfers information across the Internet to provide multi-routed and multidimensional callback processing. The hybrid network includes one or more switched networks coupled to one or more packet transmission networks, and a call router coupled to the switched communication network and the packet transmission network to route information to the appropriate switched telephony device or Internet device address. A computer with an attached display communicates with the packet transmission network. The computer is used to initiate remote management of the hybrid network, including tests of the hybrid network. The tests include circuit analysis such as selecting signaling states which could be loop start, ground start, or detecting signals such as dual tone multifrequency, multifrequency or dialpulse. The hybrid network includes support for an operator to monitor the management of the hybrid network, and an expert system to regulate the Quality of Service of the hybrid telecommunication system.

French Abstract

La presente invention se rapporte a un systeme de telecommunications hybride comprenant un reseau commute qui transmet les informations via Internet pour permettre un traitement de rappel multidimensionnel a acheminements multiples. Ce systeme hybride comprend un ou plusieurs reseaux commutes couples a un ou a plusieurs reseaux de transmission par paquets, un dispositif d'acheminement d'appels couple au reseau commute, et un reseau de paquets acheminant les informations a l'adresse du dispositif telephonique commute ou du dispositif Internet. Un ordinateur equipe d'un afficheur communique avec le reseau de paquets. L'ordinateur assure le declenchement de la telegestion du reseau hybride ainsi que des tests du reseau hybride. Ces tests comprennent l'analyse du circuit et notamment la selection des etats de signalisation ainsi que le demarrage sur court-circuit ou sur prise de terre, mais aussi la detection de signaux tels que les multifrequences bi-tons, les multifrequences ou les impulsions. Le reseau hybride assure une assistance operateur permettant de surveiller la gestion du reseau hybride, un systeme expert assurant le controle qualite de service (QOF) du systeme de telecommunications hybride.

Abstract: For Air Products and Chemicals Inc., inventory management of industrial gases at customer locations is **integrated** with vehicle scheduling and dispatching. Their advanced decision support system includes online data entry functions, customer usage forecasting, a **time** /distance network with a shortest path algorithm to compute intercustomer travel times and distances, a mathematical optimization module to produce **daily delivery schedules**, and an interactive **schedule** change interface. The optimization module uses a sophisticated Lagrangian relaxation algorithm to solve mixed integer...

Computers let steel producers go with the flow: computer-integrated manufacturing helps steel firms short-circuit problems of tracking inventory.

Hess, George W

Iron Age (Iron Age) v. 7 (Jan. '91) p. 23-5

LANGUAGE: English

ABSTRACT: The goal of computer **integrated** manufacturing in steel mills is to convert production to a more nearly continuous process. Computerized **scheduling** and tracking provides internal just-in- **time delivery** of materials, helping to eliminate **scheduling** bottlenecks. This will dramatically decrease the amount of in-house inventory that mills usually maintain because of a reduced need to **pick up** steel, move it, and put it down **repeatedly** as it goes through the mill.

The role of purchasing/transportation in cycle time reduction

Ng, Billy; Ferrin, Bruce G.; Pearson, John N.

International Journal of Operations & Production Management v17n6 PP: 574
1997

ISSN: 0144-3577 JRNL CODE: IJO

WORD COUNT: 7227

...TEXT: at managing total cycle time.

Research into carrier selection suggests that on-time pickup and **delivery** and total transit **time** may be more important selection factors than price (Baker, 1984). Even small businesses indicate that **daily scheduled pickups** and deliveries, and total transit **time**, are the two top selection criteria for carriers (Evans et al., 1990). These findings suggest that firms that aggressively manage their transportation networks are aware that transportation cycle **time** and consistency significantly influence overall performance.

Bott and Ballou (1986) classify the various methodologies for...

... United States liner trades. He concludes that the North American intermodal market has developed an **integrated** service capability that challenges traditional all water port-to-port or around-the-world liner services. Autonomous, but financially- **integrated** single mode carriers, with tightly co-ordinated operations, may provide many advantages of multimode carriers... of all parties (supplier, carrier and buyer) are consistent with the achievement of the highly **integrated**, high quality, minimal waste transactions and operations systems essential for reducing total cycle times. As...

... should be examined. The objective here is to determine whether the information essential for highly **integrated**, high quality, minimal waste operations is being effectively distributed. The essence of total cycle time management is that managers in each allied organization have the information necessary for **integrated** decision making. In other words, to manage total cycle time effectively, a manager must be...

... making teams are issues critical to total cycle time management. Practitioners must become adept at **integrated** planning and decision making. The availability of **integrated** information is an essential requirement. However, the composition of planning and decision-making teams is also critical to **integrated** planning and decision making. The composition of management teams must span the boundaries of the...

... relationship in the channel. Concurrent engineering and JIT II are two examples of this approach. **Integrated** management, crossing functional and organizational barriers, should result from the establishment of boundary spanning planning...

... incorporate the characteristics and concerns of all allied firms in the channel. The availability of **integrated** information, and the establishment of boundary spanning management teams, should facilitate **integrated** strategic planning.

In summary, time is the competitive battleground. The concept of total cycle time... M. and Crossland, P.B. (1988, "From push to pull: improving
